Character data types and common issues

EXPLORATORY DATA ANALYSIS IN SQL

SQL

Christina Maimone
Data Scientist

PostgreSQL character types

```
character(n) or char(n)
```

- fixed length n
- trailing spaces ignored in comparisons

```
character varying(n) or varchar(n)
```

variable length up to a maximum of n

```
text or varchar
```

unlimited length

Types of text data

Categorical

Tues, Tuesday, Mon, TH

shirts, shoes, hats, pants

satisfied, very satisfied, unsatisfied

0349-938, 1254-001, 5477-651

red, blue, green, yellow

Unstructured Text

I really like this product. I use it every day. It's my favorite color.

We've redesigned your favorite t-shirt to make it even better. You'll love...

Four score and seven years ago our fathers brought forth on this continent, a new nation, conceived in Liberty, and dedicated to the proposition that all men are created equal...

Grouping and counting

```
SELECT category, -- categorical variable

count(*) -- count rows for each category

FROM product -- table

GROUP BY category; -- categorical variable
```

Order: most frequent values

```
SELECT category, -- categorical variable

count(*) -- count rows for each category

FROM product -- table

GROUP BY category -- categorical variable

ORDER BY count DESC; -- show most frequent values first
```

Order: category value

```
SELECT category, -- categorical variable

count(*) -- count rows for each category

FROM product -- table

GROUP BY category -- categorical variable

ORDER BY category; -- order by categorical variable
```

Alphabetical order

```
-- Results
category | count
 apple
Apple
Banana
apple
banana 3
(5 rows)
-- Alphabetical Order:
```

```
-- Alphabetical Order:
' ' < 'A' < 'a'
```

```
-- From results
' ' < 'A' < 'B' < 'a' < 'b'
```

Common issues

Case matters

Spaces count

Empty strings aren't null

Punctuation differences

Time to examine some text data

EXPLORATORY DATA ANALYSIS IN SQL

Cases and Spaces

EXPLORATORY DATA ANALYSIS IN SQL

Christina Maimone
Data Scientist

Converting case

```
SELECT lower('aBc DeFg 7-');

abc defg 7-

SELECT upper('aBc DeFg 7-');

ABC DEFG 7-
```

Case insensitive comparisons

```
SELECT *
FROM fruit;
```

```
customer | fav_fruit
     349 | apple
                        <- #1
     874 | Apple
                           <- #2
     703
            apple
                           <- #3
     667 | bannana
     622
           banana
     387 | BANANA
     300 | APPLES
                           <- #4
     313 | apple
                           <- #5
     499 | banana
     418 | apple
                           <- #6
     841 | BANANA
     300 | APPLE
                           <- #7
     754 | apple
                           <- #8
(13 rows)
```

```
SELECT *
  FROM fruit
WHERE lower(fav_fruit)='apple';
```

Case insensitive searches

```
-- Using LIKE

SELECT *

FROM fruit
-- "apple" in value

WHERE fav_fruit LIKE '%apple%';
```

```
-- Using ILIKE

SELECT *
FROM fruit
-- ILIKE for case insensitive
WHERE fav_fruit ILIKE '%apple%';
```

Watch out!

```
SELECT fruit
FROM fruit2;
```

```
fruit
-----
apple
banana
pineapple
grapefruit
grapes
```

```
SELECT fruit
FROM fruit2
WHERE fruit LIKE '%apple%';
```

```
fruit
-----
apple
pineapple
```

Trimming spaces

```
SELECT trim(' abc ');

• trim or btrim: both ends

• trim(' abc ') = 'abc'

• rtrim: right end

• rtrim(' abc ') = 'abc'

• ltrim: left start

• ltrim(' abc ') = 'abc'
```

Trimming other values

```
SELECT trim('Wow!', '!');

Wow

SELECT trim('Wow!', '!wW');

o
```

Combining functions

```
SELECT trim(lower('Wow!'), '!w');
```

0

Bring order to messy text!

EXPLORATORY DATA ANALYSIS IN SQL

Splitting and concatenating text

EXPLORATORY DATA ANALYSIS IN SQL

Christina Maimone
Data Scientist

Substring

```
SELECT left('abcde', 2), -- first 2 characters
      right('abcde', 2); -- last 2 characters
left | right
     de
ab
SELECT left('abc', 10),
      length(left('abc', 10));
left | length
abc 3
```

Substring

```
SELECT substring(string FROM start FOR length);

SELECT substring('abcdef' FROM 2 FOR 3);

bcd

SELECT substr('abcdef', 2, 3);
```

Delimiters

```
some text, more text, still more text

^ ^
delimiter delimiter
```

Fields/chunks:

- 1. some text
- 2. more text
- 3. still more text

Splitting on a delimiter

```
SELECT split_part(string, delimiter, part);

SELECT split_part('a,bc,d', ',', 2);
```

bc

Splitting on a delimiter

```
SELECT split_part('cats and dogs and fish', ' and ', 1);
```

cats

Concatenating text

```
SELECT concat('a', 2, 'cc');
a2cc
SELECT 'a' || 2 || 'cc';
a2cc
SELECT concat('a', NULL, 'cc');
acc
SELECT 'a' || NULL || 'cc';
```

Manipulate some strings!

EXPLORATORY DATA ANALYSIS IN SQL

Strategies for Multiple Transformations

EXPLORATORY DATA ANALYSIS IN SQL

SQL

Christina Maimone
Data Scientist

Multiple transformations

```
SELECT * FROM naics;
```

id	category	bu	sinesses
111110	Agriculture: Soybean Farming	-	 4788
111130	Agriculture Dry Pea and Bean Farming	-1	3606
111140	Agriculture: Wheat Farming	-1	6393
111150	Agriculture – Corn Farming	-1	26469
111160	Agriculture: Rice Farming	-1	949
111199	Agriculture – All Other Grain Farming	-1	15035
111211	Agriculture Potato Farming	-1	617
611110	Education – Elementary and Secondary	-1	187859
611210	Education Junior Colleges	-1	3961
611310	Education: Colleges and Universities	- 1	29148

CASE WHEN

```
-- Case for each of :, -, and |

SELECT CASE WHEN category LIKE '%: %' THEN split_part(category, ': ', 1)

WHEN category LIKE '% - %' THEN split_part(category, ' - ', 1)

ELSE split_part(category, ' | ', 1)

END AS major_category, -- alias the result

sum(businesses) -- also select number of businesses

FROM naics

GROUP BY major_category; -- Group by categories created above
```

Recoding table

Original values: fruit table

```
customer | fav_fruit
    349 | apple
    874 | Apple
          apple
    667 | bannana
    622 banana
    387 l
          BANANA
    300 | APPLES
    313 l
          apple
    499
           banana
    418
          apple
          BANANA
    841 |
    300 | APPLE
    754 | apple
```

Standardized values: recode table

```
original | standardized
         | apple
APPLES
       | apple
apple
Apple
         | apple
bannana
          banana
         | apple
apple
 banana
          banana
banana
         banana
APPLE
         | apple
         | apple
 apple
BANANA
          banana
```

Step 1: CREATE TEMP TABLE

```
CREATE TEMP TABLE recode AS

SELECT DISTINCT fav_fruit AS original, -- original, messy values

fav_fruit AS standardized -- new standardized values

FROM fruit;
```

Initial table

```
SELECT *
FROM recode;
```

```
original | standardized
APPLES
          | APPLES
apple
         | apple
          | Apple
Apple
           bannana
bannana
          | apple
apple
 banana
            banana
banana
           banana
APPLE
          | APPLE
 apple
            apple
BANANA
           BANANA
(10 rows)
```

Step 2: UPDATE values

```
UPDATE table_name
   SET column_name = new_value
WHERE condition;
```

Step 2: UPDATE values

```
-- All rows: lower case, remove white space on ends
UPDATE recode
  SET standardized=trim(lower(original));
-- Specific rows: correct a misspelling
UPDATE recode
   SET standardized='banana'
 WHERE standardized LIKE '%nn%';
-- All rows: remove any s
UPDATE recode
  SET standardized=rtrim(standardized, 's');
```

Resulting recode table

```
SELECT *
FROM recode;
```

```
original | standardized
          | apple
APPLES
         | apple
apple
         | apple
Apple
apple
          | apple
 banana
            banana
            banana
banana
APPLE
           apple
          | apple
 apple
BANANA
            banana
bannana
            banana
(10 rows)
```

Step 3: JOIN original and recode tables

Original only

```
SELECT fav_fruit, count(*)
FROM fruit
GROUP BY fav_fruit;
```

With recoded values

Recap

- 1. CREATE TEMP TABLE with original values
- 2. UPDATE to create standardized values
- 3. JOIN original data to standardized data

Clean up the Evanston 311 data!
